Bacteria

Teacher's Version

Bacteria

The importance of washing their hands before a meal is emphasised to small children as a way of keeping healthy. But do you ever think about germs and disease? It is true that some bacteria, and other micro-organisms, can cause serious problems, but most bacteria are not especially harmful. In fact, without bacteria, there would be no life on Earth as we know it.

Bacteria that live in soil break down, or decompose, the remains of dead plants and animal material. In the process, the bacteria make essential substances available to be used by living plants as they grow. These pass to the animals that eat the plants. Of course the bacteria do not do this to be helpful; it is just the way they obtain the energy they need to survive.

Some bacteria live in the digestive systems of humans and animals. This benefits the bacteria as they have a regular **supply** of food, and benefits humans and animals as the bacteria **release** nutrients from the food that would otherwise pass through them.

Humans have found many **surprising** ways to turn some extraordinary bacteria and other micro-organisms to our **advantage**. We use the **properties** of bacteria to produce milk and to make cheese, butter and yoghurt. Bacteria can also be used in **medicine** to stop the effects of other bacteria that cause **physical** illness.

No one knows how many **varieties** of bacteria there might be, or what they could all be used for. But one thing to **remember** is that if we, or any other organism, can benefit from this it may be more by chance than **design**.
